CZECH BIOIMAGING — Imaging principles of life

EURO-BIOIMAGING

OPEN ACCESS = advanced microscopy for everyone

ONLY users' projects and user inspired methodological projects

1. **Light microscopy**
   - **11 high-end systems**
   - **(mostly)** user operated
2. **Electron microscopy**
   - **FIB-SEM, TEM**
   - **+ sample preparation**
   - **(mostly)** staff operated
3. **Flow cytometry**
   - **2 analyzers + 1 sorter**
   - user and staff operated
4. **Image Data Analysis**
   - **Commercial software + hardware**
   - assistance

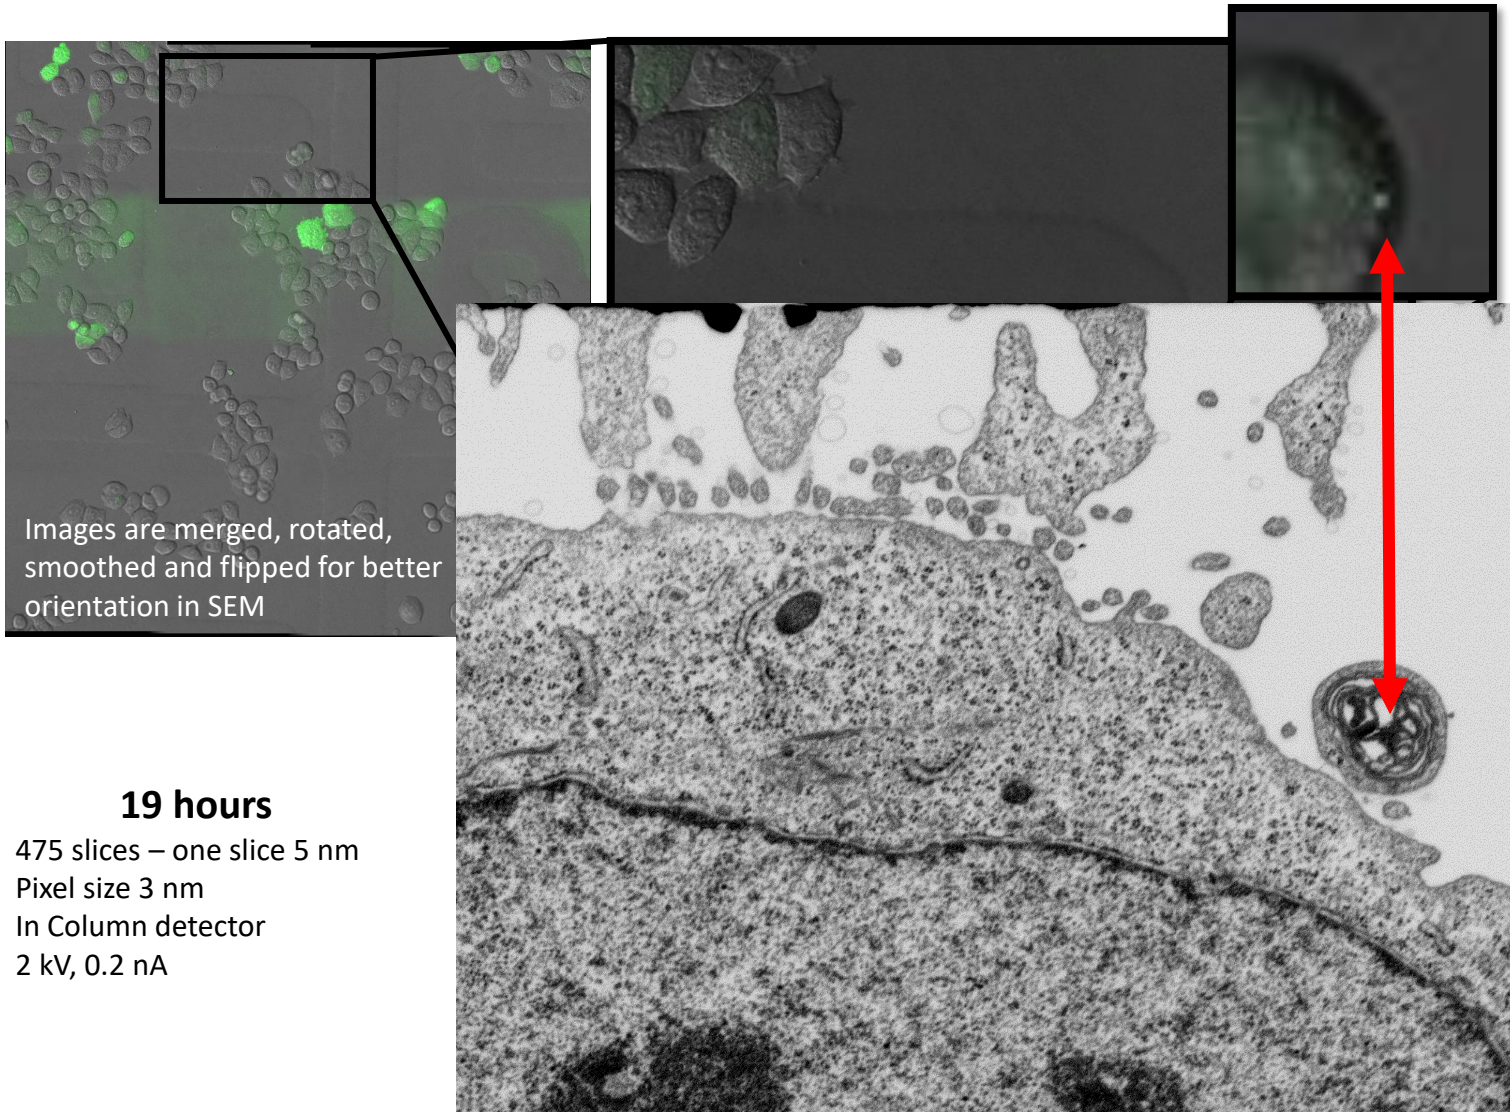
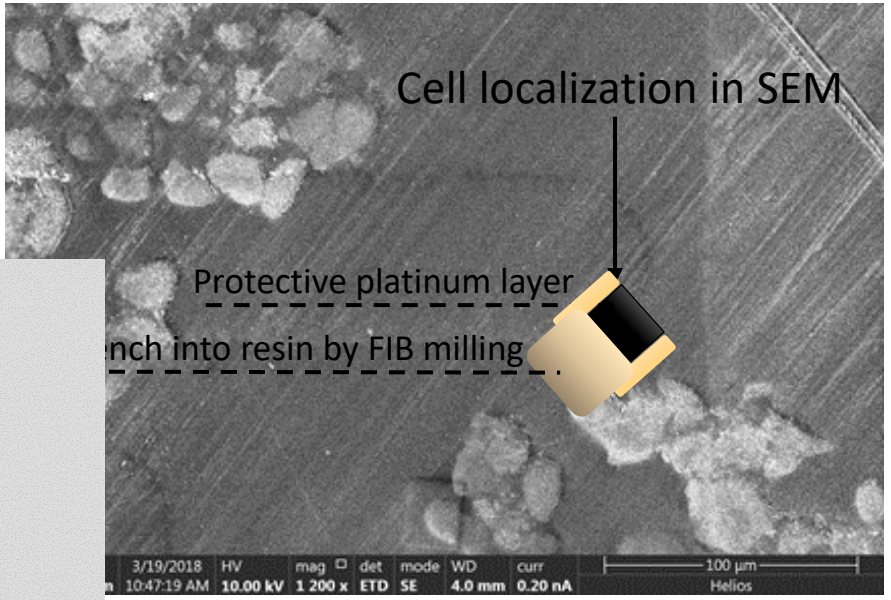
The passive translocation mechanism of arginine-rich cell penetrating peptides

BIOCEV





19 hours

- 475 slices – one slice 5 nm
- Pixel size 3 nm
- In Column detector
- 2 kV, 0.2 nA

Allolio, C. *et al.* Arginine-rich cell-penetrating peptides induce membrane multilamellarity and subsequently enter via formation of a fusion pore. *Proc. Natl. Acad. Sci.* 201811520 (2018). doi:10.1073/pnas.1811520115

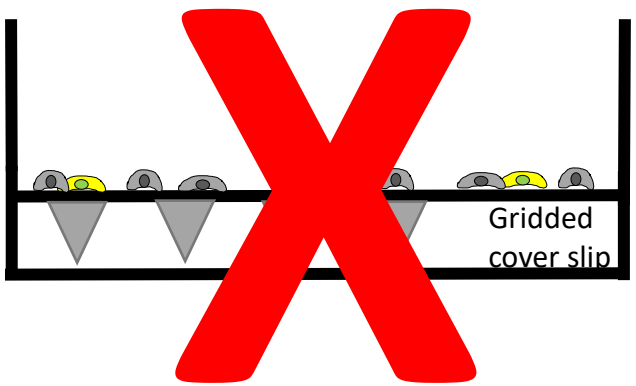
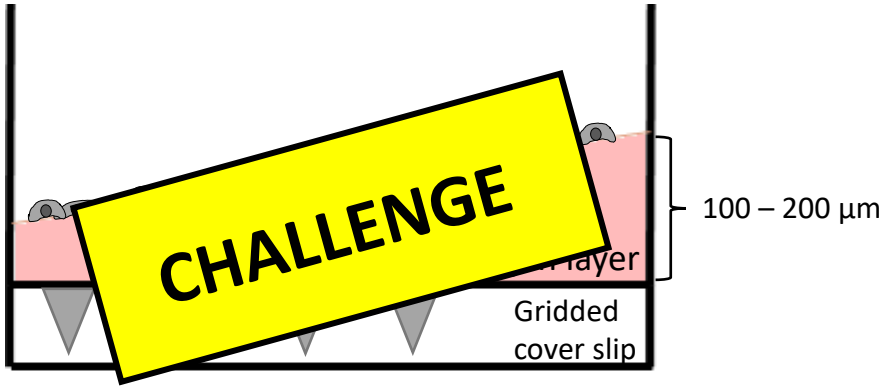
When cells are far away from the cover slip……





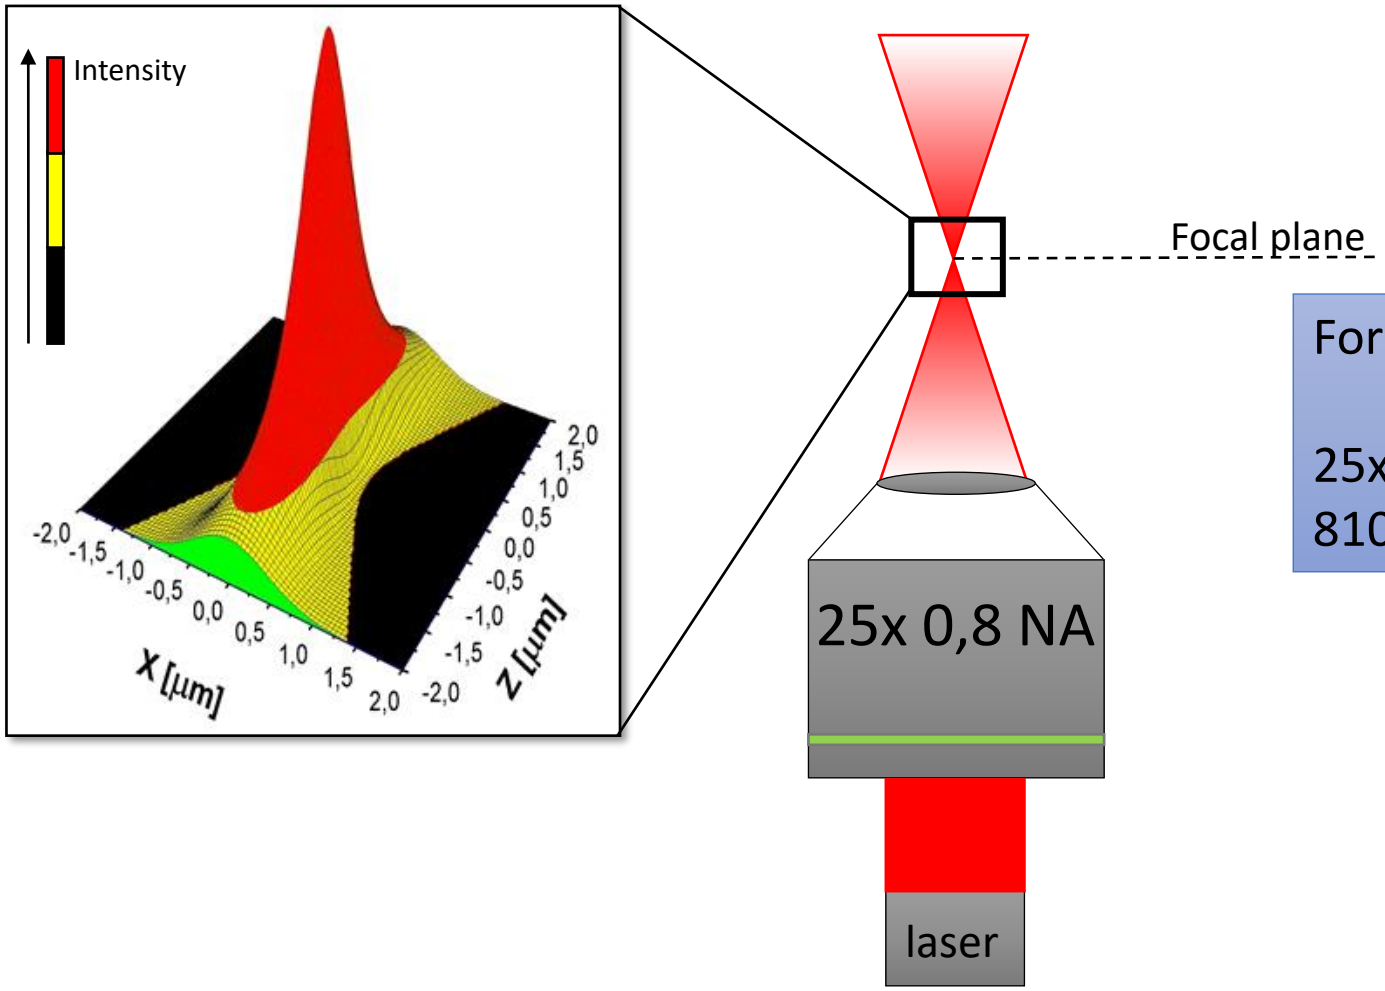
Limitations

- a cell deep inside the resin can not be localized by an overview SEM
- the depth of milled trench for high quality FIB-SEM is limited (standard depth is 5 µm)
- trimming away the resin up to the targeted cell also removes the imprinted grid ☹

The aim – to analyze cancer cell invadopodia ultrastructure in 3D environment and the transport mechanism of lytic enzymes to ECM degradation sites.

Method – CLEM combining fluorescence live cell experiments of cancer cells grown on collagen, expressing genetically labeled matrix metalloproteinases, with FIB-SEM imaging of tumor cells invading the collagen matrix.

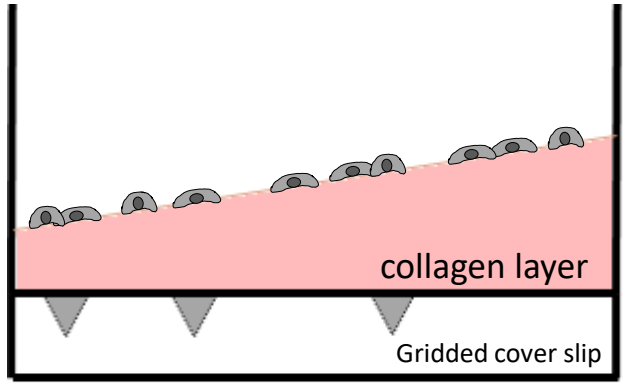
New workflow that extends the pattern from the surface grid deep inside the resin block by using IR laser induced bubbles.



For bubbles burning:

25x WI, 0.8 NA objective
810 nm 2P laser (20-100 mW at sample position)

Cells cultivation on/inside collagen layer in a patterned dish



Live-cell imaging (3D confocal fluorescent and BF images)

Carl Zeiss LSM880 NLO

Sample preparation for FIB-SEM

- Osmium postfixation
- Contrasting with 1% UA
- Dehydration with EtOH
- EPON embedding

Return to confocal microscope

Near-infrared branding (NIRB)

IR laser burning bubbles into a resin block around the selected cell

Carl Zeiss LSM880 NLO

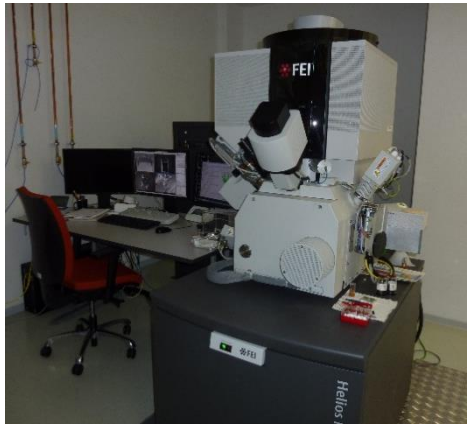
Remove the block from the patterned dish

Targeted ultramicrotomy

Ultramicrotome Leica EM UC7

Sputter coating with 25 nm Pt

Targeted 3D FIB-SEM



FIB-SEM FEI Helios NanoLab 660 G3

Correlation with 3D fluorescent dataset

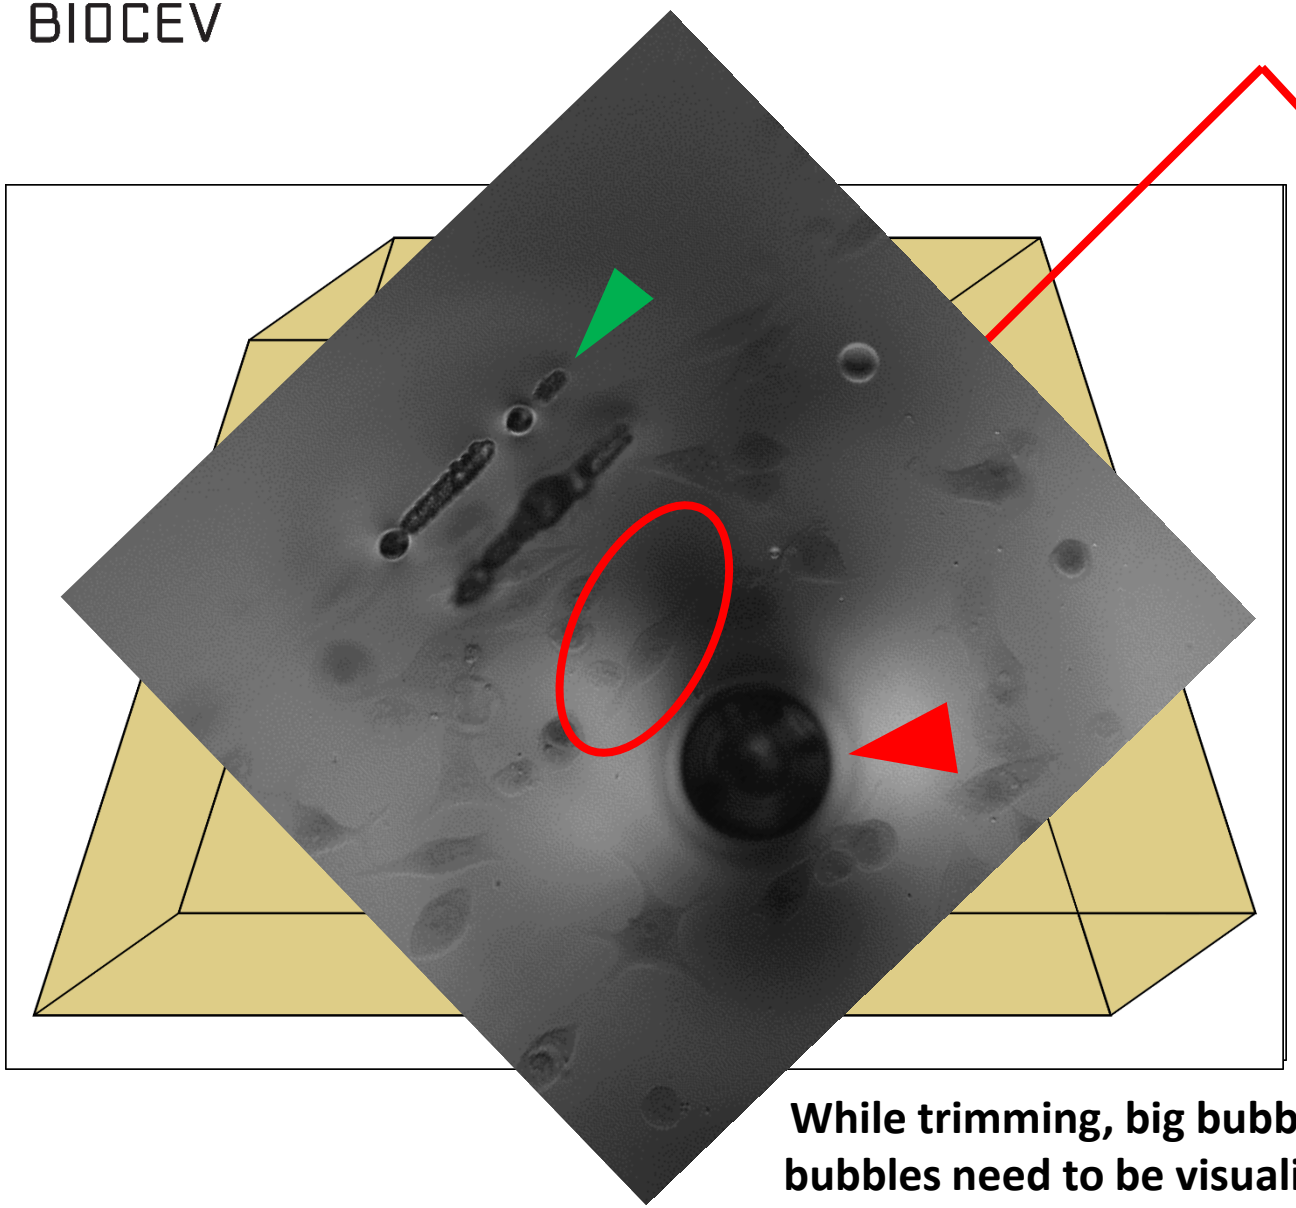
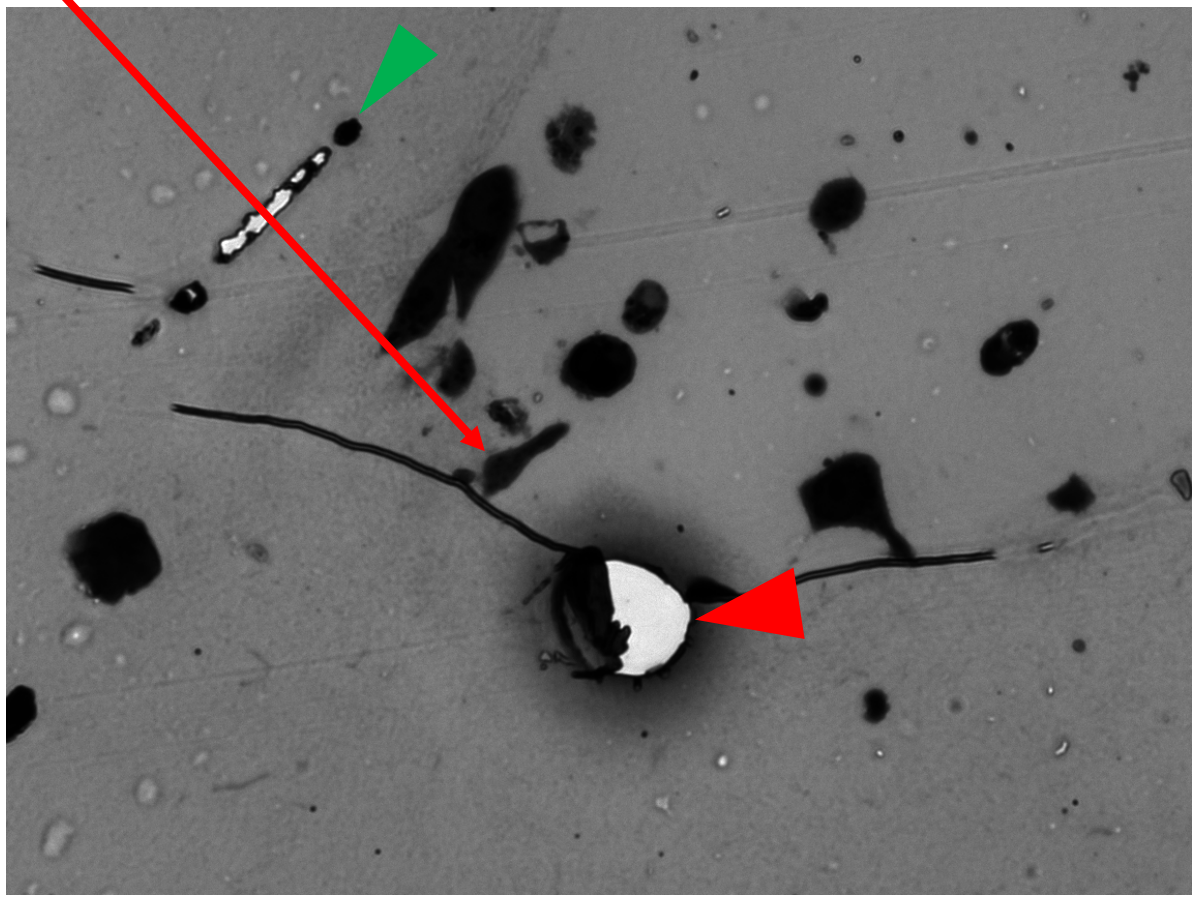
BIOCEV

Bubbles assisted cutting through the collagen layer





While trimming, big bubbles are visible with the ultramicrotome optics, cells and line-bubbles need to be visualized by staining sections with toluidine blue.

BIOCEV

FIB SEM targeting and milling

After finishing trimming, the block was prepared for imaging by FIB-SEM. The sample was mounted on a regular SEM stub using conductive carbon and then coated with 25 nm of platinum

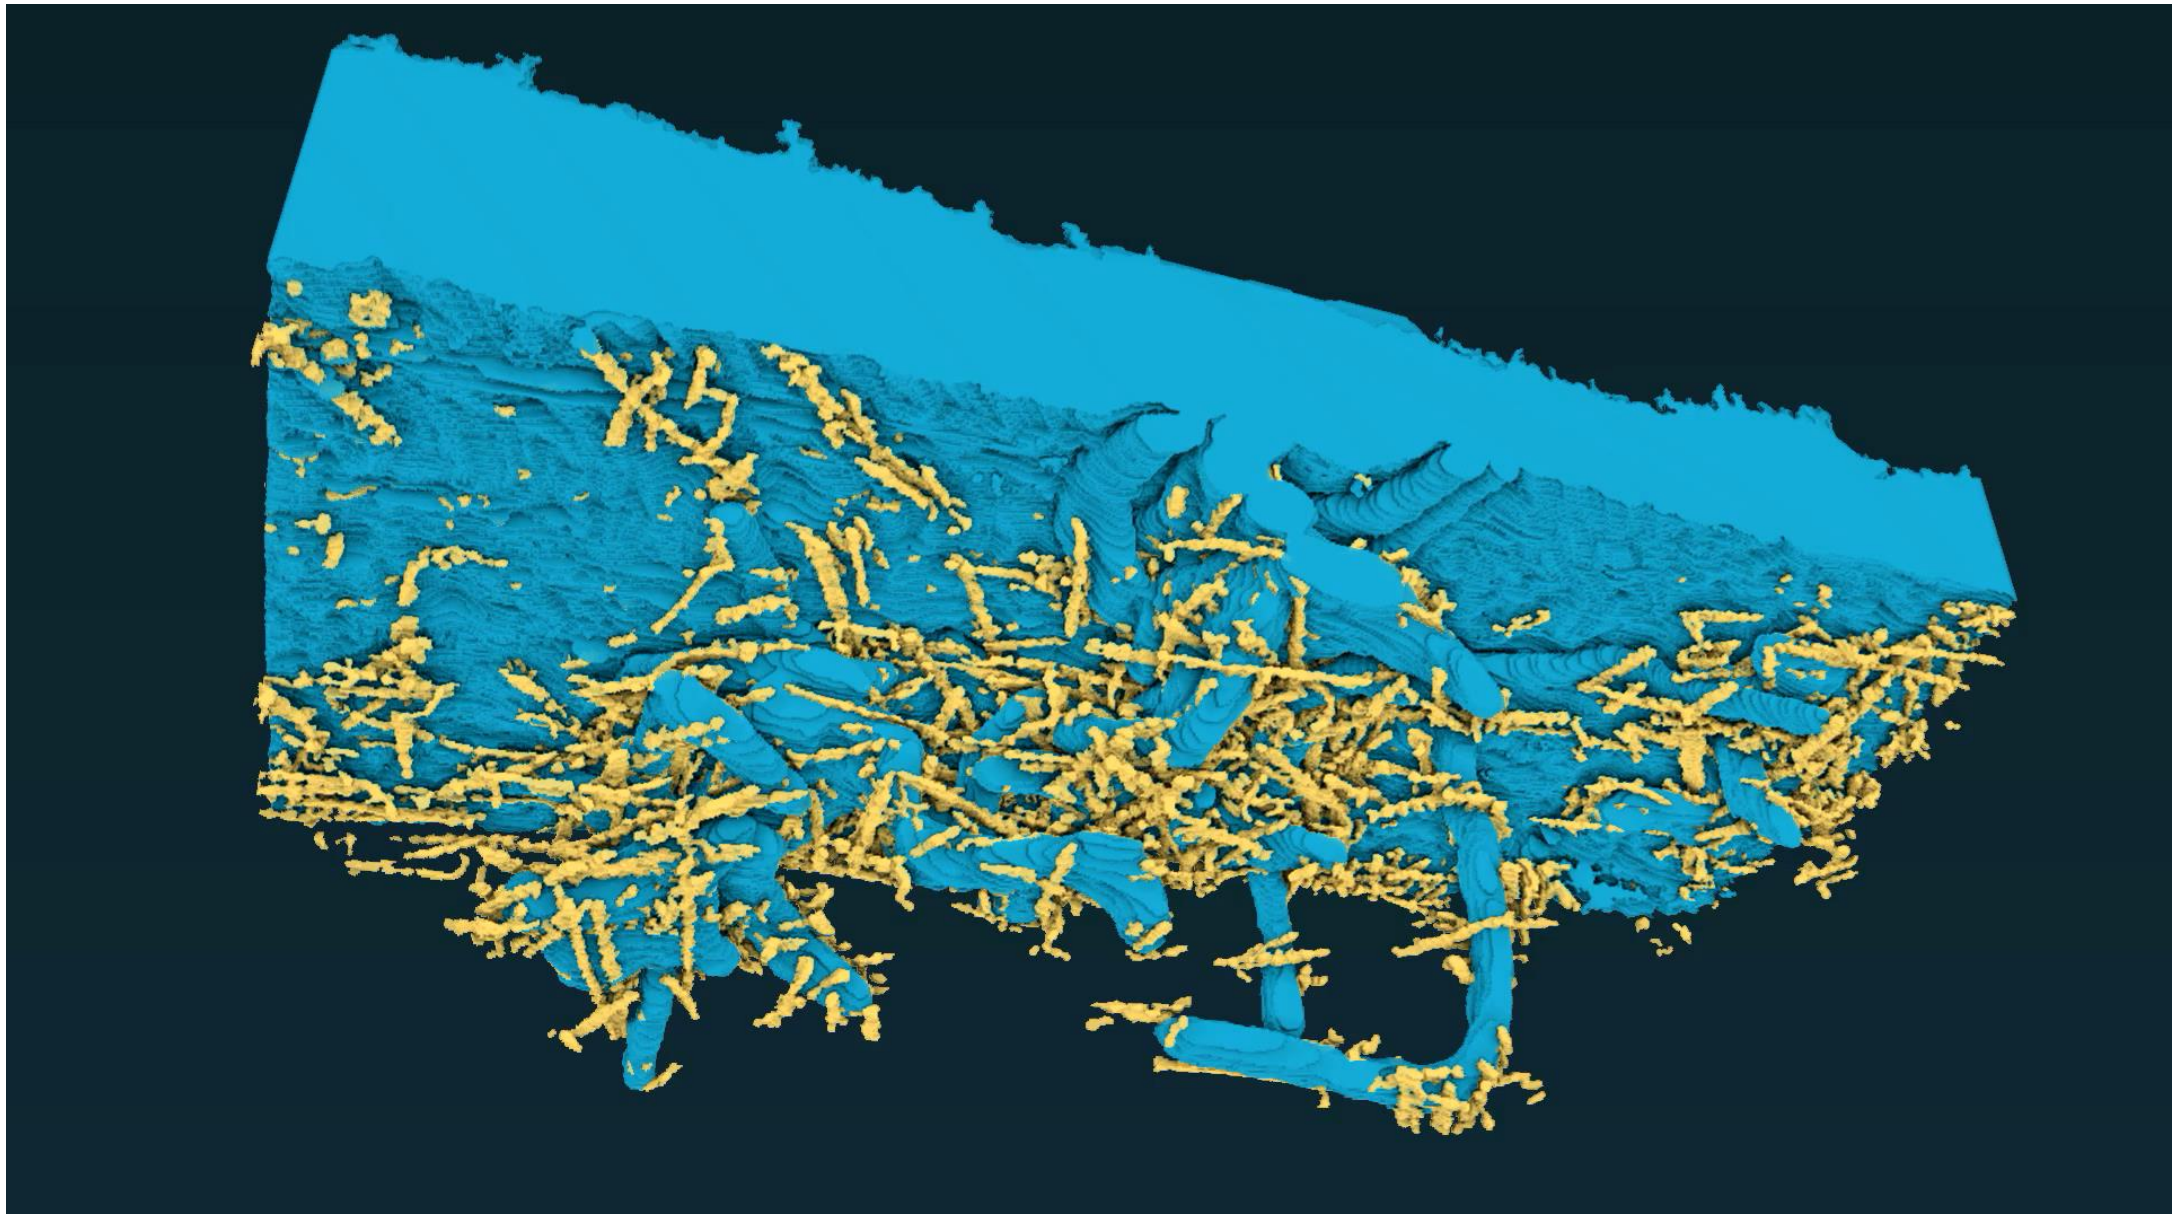
Dalecká, M. et al. „Invadopodia Structure in 3D Environment Resolved by Near-Infrared Branding Protocol Combining Correlative Confocal and FIB-SEM Microscopy.“ Int. J. Mol. Sci. **2021**, 22, 7805.

Collagen fibers in a close contact with invadopodia



BIOCEV

Other applications?

- FIB-SEM targeting of samples which are embedded deep in the volume of the resin

Example: a suspension of bacteria and cells of interest
